You need to design a database for the e-railway service. The following are fields that should be present in the tables.

Train No.	The train name
Train Name	The train number
Islno	The stoppage number for that train number
Station Code	The station code
Station Name	The station name
Arrival Time	Arrival time (HH:MM:SS)
Departure Time	Departure time (HH:MM:SS)
Distance	Distance (kms)
Source Station Code	Source station code
Source Station Name	Source station name
Destination Station Code	Destination station code
Destination Station Name	Destination station name

Normalize the given data into tables.
Apply the suitable constraints on the tables(eg. Primary key, foreign key, not null, unique, etc). The above-given fields must and should present in the tables. You are free to use other extra fields if you required it.
